## 13 Output, 3.3V SDRAM Buffer for Desktop PCs with 3 DIMMs

## Features

- One input to 13 output buffer/driver
- Supports up to three SDRAM DIMMs
- One additional outputs for feedback
- Serial interface for output control
- Low skew outputs
- Up to $\mathbf{1 0 0}-\mathrm{MHz}$ operation
- Multiple $\mathrm{V}_{\mathrm{DD}}$ and $\mathrm{V}_{\mathrm{SS}}$ pins for noise reduction
- Low EMI outputs
- 28-pin SOIC (300-mil) package
-3.3V operation

## Functional Description

The CY2313ANZ is a 3.3 V buffer designed to distribute high-speed clocks in desktop PC applications. The part has 13 outputs, 12 of which can be used to drive up to three SDRAM DIMMs, and the remaining can be used for external feedback to a PLL. The device operates at 3.3 V and outputs can run up to 100 MHz , thus making it compatible with Pentium ${ }^{\circledR}$ II processors. The CY2313ANZ can be used in conjunction with the CY2280, CY2281, CY2282 or similar clock synthesizer for a complete Pentium II motherboard solution.
The CY2313ANZ also includes a serial interface which can enable or disable each output clock. On power-up, all output clocks are enabled.

## Serial Configuration Map

- The Serial bits will be read by the clock driver in the following order:

Byte 0 - Bits 7, 6, 5, 4, 3, 2, 1, 0
Byte 1 - Bits 7, 6, 5, 4, 3, 2, 1, 0

Byte N - Bits 7, 6, 5, 4, 3, 2, 1, 0

- Reserved and unused bits should be programmed to " 0 "
- Serial interface address for the CY2313ANZ is:

## Notes:

1. Electrical parameters are guaranteed under the operating conditions specified.
2. BUF_IN input has a threshold voltage of $\mathrm{V}_{\mathrm{DD}} / 2$.
3. Parameter is guaranteed by design and characterization. Not $100 \%$ tested in production.

## Summary

- Surface mount, low-ESR, ceramic capacitors should be used for filtering. Typically, these capacitors have a value of $0.1 \mu \mathrm{~F}$. In some cases, smaller value capacitors may be required.
- The value of the series terminating resistor satisfies the following equation, where Rtrace is the loaded characteristic impedance of the trace, Rout is the output impedance of the buffer (typically $25 \Omega$ ), and Rseries is the series terminating resistor.
Rseries > Rtrace - Rout
- Footprints must be laid out for optional EMI-reducing capacitors, which should be placed as close to the terminating resistor as is physically possible. Typical values of these capacitors range from 4.7 pF to 22 pF .
- A Ferrite Bead may be used to isolate the Board $\mathrm{V}_{D D}$ from the clock generator $\mathrm{V}_{D D}$ island. Ensure that the Ferrite Bead offers greater than $50 \Omega$ impedance at the clock frequency, under loaded DC conditions. Please refer to the application note "Layout and Termination Techniques for Cypress Clock Generators" for more details.
- If a Ferrite Bead is used, a $10 \mu \mathrm{~F}-22 \mu \mathrm{~F}$ tantalum bypass capacitor should be placed close to the Ferrite Bead. This capacitor prevents power supply droop during current surges.
