

# 256Mb D-die DDR400 SDRAM Specification

Revision 1.1

---

**256Mb D-die Revision History**

**Revision 0.0 (June. 2002)**

1. First release

**Revision 0.1 (Aug. 2002)**

- Changed IDD3P value from 40mA to 55m
- Changed IDD3N value from 60mA to 75mA

**Revision 1.0 (February, 2003)**

- Modified AC Timing Parameters and Idd value.

**Revision 1.1 (February, 2003)**

- Modified tAC value +/-0.7ns => +/-0.65ns

**Key Features**

- 200MHz Clock, 400Mbps data rate.
- VDD= +2.6V ± 0.10V, VDDQ= +2.6V ± 0.10V
- Double-data-rate architecture; two data transfers per clock cycle
- Bidirectional data strobe(DQS)
- Four banks operation
- Differential clock inputs(CK and  $\overline{CK}$ )
- DLL aligns DQ and DQS transition with CK transition
- MRS cycle with address key programs
  - . Read latency 3 (clock) for DDR400 , 2.5 (clock) for DDR333
  - . Burst length (2, 4, 8)
  - . Burst type (sequential & interleave)
- All inputs except data & DM are sampled at the positive going edge of the system clock(CK)
- Data I/O transactions on both edges of data strobe
- Edge aligned data output, center aligned data input
- LDM,UDM for write masking only (x16)
- DM for write masking only (x8)
- Auto & Self refresh
- 7.8us refresh interval(8K/64ms refresh)
- Maximum burst refresh cycle : 8
- 66pin TSOP II package

**Ordering Information**

Part No.	Org.	Max Freq.	Interface	Package
K4H560838D-TCCC	32M x 8	CC(DDR400@CL=3)	SSTL2	66pin TSOP II
K4H560838D-TCC4		C4(DDR400@CL=3)		
K4H561638D-TCCC	16M x 16	CC(DDR400@CL=3)	SSTL2	66pin TSOP II
K4H561638D-TCC4		C4(DDR400@CL=3)		

**Operating Frequencies**

	- CC(DDR400@CL=3)	- C4(DDR400@CL=3)
Speed @CL3	200MHz	200MHz
CL-tRCD-tRP	3 - 3 - 3	3 - 4 - 4

\*CL : CAS Latency

Pin Description

Organization	Row Address	Column Address
32Mx8	A0~A12	A0-A9
16Mx16	A0~A12	A0-A8

DM is internally loaded to match DQ and DQS identically.

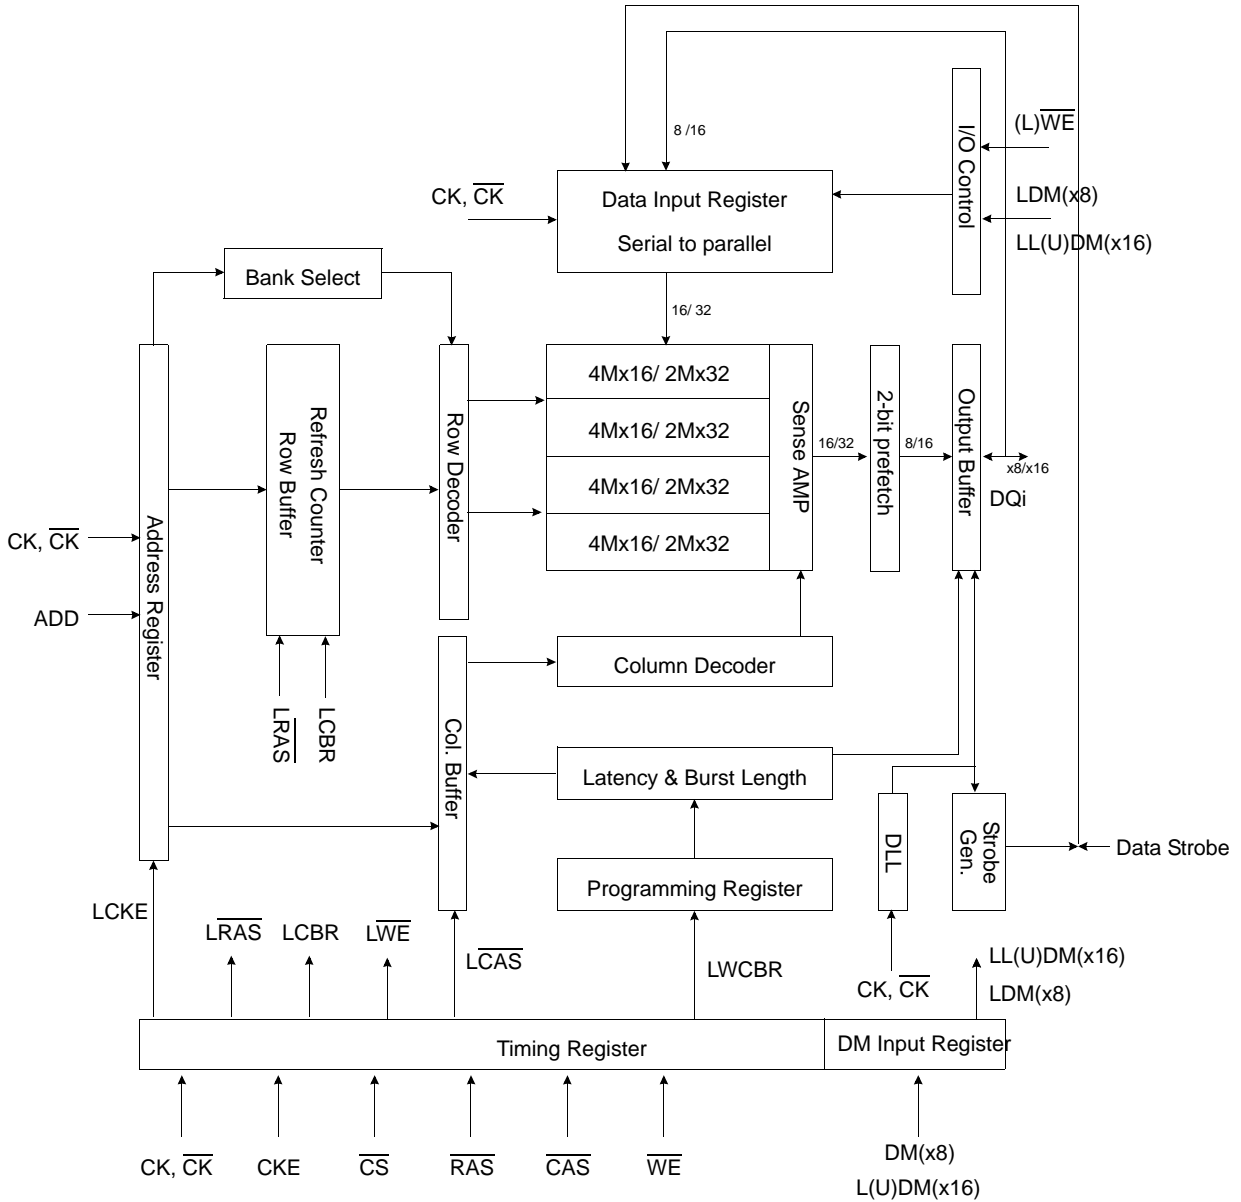

**Row & Column address configuration**

Package Physical Dimension

66pin TSOP II / Package dimension

Block Diagram (8Mbx8 / 4Mbx16 I/O x 4 Banks)

Input/Output Function Description

SYMBOL	TYPE	DESCRIPTION
CK, $\overline{CK}$	Input	Clock : CK and $\overline{CK}$ are differential clock inputs. All address and control input signals are sampled on the positive edge of CK and negative edge of $\overline{CK}$ . Output (read) data is referenced to both edges of CK. Internal clock signals are derived from CK/ $\overline{CK}$ .
CKE	Input	Clock Enable : CKE HIGH activates, and CKE LOW deactivates internal clock signals, and device input buffers and output drivers. Deactivating the clock provides PRECHARGE POWER-DOWN and SELF REFRESH operation (all banks idle), or ACTIVE POWER-DOWN (row ACTIVE in any bank). CKE is synchronous for all functions except for disabling outputs, which is achieved asynchronously. Input buffers, excluding CK, $\overline{CK}$ and CKE are disabled during power-down and self refresh modes, providing low standby power. CKE will recognize an LVCMOS LOW level prior to VREF being stable on power-up.
$\overline{CS}$	Input	Chip Select : $\overline{CS}$ enables (registered LOW) and disables (registered HIGH) the command decoder. All commands are masked when $\overline{CS}$ is registered HIGH. $\overline{CS}$ provides for external bank selection on systems with multiple banks. $\overline{CS}$ is considered part of the command code.
$\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$	Input	Command Inputs : $\overline{RAS}$ , $\overline{CAS}$ and $\overline{WE}$ (along with $\overline{CS}$ ) define the command being entered.
LDM,(UDM)	Input	Input Data Mask : DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. Although DM pins are input only, the DM loading matches the DQ and DQS loading. For the x16, LDM corresponds to the data on DQ0~D7 ; UDM corresponds to the data on DQ8~DQ15. DM may be driven high, low, or floating during READs.
BA0, BA1	Input	Bank Address Inputs : BA0 and BA1 define to which bank an ACTIVE, READ, WRITE or PRECHARGE command is being applied.
A [0 : 12]	Input	Address Inputs : Provide the row address for ACTIVE commands, and the column address and AUTO PRECHARGE bit for READ/WRITE commands, to select one location out of the memory array in the respective bank. A10 is sampled during a PRECHARGE command to determine whether the PRECHARGE applies to one bank (A10 LOW) or all banks (A10 HIGH). If only one bank is to be precharged, the bank is selected by BA0, BA1. The address inputs also provide the op-code during a MODE REGISTER SET command. BA0 and BA1 define which mode register is loaded during the MODE REGISTER SET command (MRS or EMRS). A12 & A13 are used on device densities of 256Mb and greater, and A13 is used only on 1Gb devices.
DQ	I/O	Data Input/Output : Data bus
LDQS,(U)DQS	I/O	Data Strobe : Output with read data, input with write data. Edge-aligned with read data, centered in write data. Used to capture write data. For the x16, LDQS corresponds to the data on DQ0~D7 ; UDQS corresponds to the data on DQ8~DQ15
NC	-	No Connect : No internal electrical connection is present.
VDDQ	Supply	DQ Power Supply : +2.6V ± 0.1V.
VSSQ	Supply	DQ Ground.
VDD	Supply	Power Supply : +2.6V ± 0.1V (device specific).
VSS	Supply	Ground.
VREF	Input	SSTL_2 reference voltage.

Command Truth Table

(V=Valid, X=Don't Care, H=Logic High, L=Logic Low)

COMMAND		CKEn-1	CKEn	$\overline{CS}$	$\overline{RAS}$	$\overline{CAS}$	$\overline{WE}$	BA0,1	A10/AP	A0 ~ A9, A11, A12	Note

				L	V	V	V					
	Exit	L	H	X	X	X	X					
Precharge Power Down Mode	Entry	H	L	H	X	X	X	X				
				L	H	H	H					
	Exit	L	H	H	X	X	X	X				
				L	V	V	V					
DM(UDM/LDM for x16 only)		H		X				X			8	
No operation (NOP) : Not defined		H	X	H	X	X	X	X			9	
				L	H	H	H				9	

- Note :**
- OP Code : Operand Code. A0 ~ A12 & BA0 ~ BA1 : Program keys. (@EMRS/MRS)
  - EMRS/MRS can be issued only at all banks precharge state.  
A new command can be issued 2 clock cycles after EMRS or MRS.
  - Auto refresh functions are same as the CBR refresh of DRAM.  
The automatical precharge without row precharge command is meant by "Auto".  
Auto/self refresh can be issued only at all banks precharge state.
  - BA0 ~ BA1 : Bank select addresses.  
If both BA0 and BA1 are "Low" at read, write, row active and precharge, bank A is selected.  
If BA0 is "High" and BA1 is "Low" at read, write, row active and precharge, bank B is selected.  
If BA0 is "Low" and BA1 is "High" at read, write, row active and precharge, bank C is selected.  
If both BA0 and BA1 are "High" at read, write, row active and precharge, bank D is selected.
  - If A10/AP is "High" at row precharge, BA0 and BA1 are ignored and all banks are selected.
  - During burst write with auto precharge, new read/write command can not be issued.  
Another bank read/write command can be issued after the end of burst.  
New row active of the associated bank can be issued at tRP after the end of burst.
  - Burst stop command is valid at every burst length.
  - DM(x4/8) sampled at the rising and falling edges of the DQS and Data-in are masked at the both edges (Write DM latency is 0).  
UDM/LDM(x16 only) sampled at the rising and falling edges of the UDQS/LDQS and Data-in are masked at the both edges (Write UDM/LDM latency is 0).
  - This combination is not defined for any function, which means "No Operation(NOP)" in DDR SDRAM.

8M x 8Bit x 4 Banks / 4M x 16Bit x 4 Banks Double Data Rate SDRAM

General Description

The K4H560838D / K4H561638D is 268,435,456 bits of double data rate synchronous DRAM organized as 4x 8,388,608 / 4x 4,194,304 words by 8/16bits, fabricated with SAMSUNG's high performance CMOS technology. Synchronous features with Data Strobe allow extremely high performance up to 400Mb/s per pin. I/O transactions are possible on both edges of DQS. Range of operating frequencies, programmable burst length and programmable latencies allow the device to be useful for a variety of high performance memory system applications.

Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Voltage on any pin relative to V <sub>SS</sub>	V <sub>IN</sub> , V <sub>OUT</sub>	-0.5 ~ 3.6	V
Voltage on V <sub>DD</sub> & V <sub>DDQ</sub> supply relative to V <sub>SS</sub>	V <sub>DD</sub> , V <sub>DDQ</sub>	-1.0 ~ 3.6	V
Storage temperature	T <sub>STG</sub>	-55 ~ +150	°C
Power dissipation	P <sub>D</sub>	1.5	W
Short circuit current	I <sub>OS</sub>	50	mA

**Note :** Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.  
 Functional operation should be restricted to recommend operation condition.  
 Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

DC Operating Conditions

Recommended operating conditions(Voltage referenced to V<sub>SS</sub>=0V, T<sub>A</sub>=0 to 70°C)

Parameter	Symbol	Min	Max	Unit	Note
Supply voltage(for device with a nominal V <sub>DD</sub> of 2.5V)	V <sub>DD</sub>	2.5	2.7		5
I/O Supply voltage	V <sub>DDQ</sub>	2.5	2.7	V	5
I/O Reference voltage	V <sub>REF</sub>	0.49*V <sub>DDQ</sub>	0.51*V <sub>DDQ</sub>	V	1
I/O Termination voltage(system)	V <sub>TT</sub>	V <sub>REF</sub> -0.04	V <sub>REF</sub> +0.04	V	2
Input logic high voltage	V <sub>IH</sub> (DC)	V <sub>REF</sub> +0.15	V <sub>DDQ</sub> +0.3	V	
Input logic low voltage	V <sub>IL</sub> (DC)	-0.3	V <sub>REF</sub> -0.15	V	
Input Voltage Level, CK and $\overline{CK}$ inputs	V <sub>IN</sub> (DC)	-0.3	V <sub>DDQ</sub> +0.3	V	
Input Differential Voltage, CK and $\overline{CK}$ inputs	V <sub>ID</sub> (DC)	0.36	V <sub>DDQ</sub> +0.6	V	3
V-I Matching: Pullup to Pulldown Current Ratio	V <sub>I</sub> (Ratio)	0.71	1.4	-	4
Input leakage current	I <sub>I</sub>	-2	2	uA	
Output leakage current	I <sub>OZ</sub>	-5	5	uA	
Output High Current(Normal strength driver) ;V <sub>OUT</sub> = V <sub>TT</sub> + 0.84V	I <sub>OH</sub>	-16.8		mA	
Output High Current(Normal strength driver) ;V <sub>OUT</sub> = V <sub>TT</sub> - 0.84V	I <sub>OL</sub>	16.8		mA	
Output High Current(Half strength driver) ;V <sub>OUT</sub> = V <sub>TT</sub> + 0.45V	I <sub>OH</sub>	-9		mA	
Output High Current(Half strength driver) ;V <sub>OUT</sub> = V <sub>TT</sub> - 0.45V	I <sub>OL</sub>	9		mA	

- Note :**
- 1.V<sub>REF</sub> is expected to be equal to 0.5\*V<sub>DDQ</sub> of the transmitting device, and to track variations in the dc level of same. Peak-to-peak noise on V<sub>REF</sub> may not exceed +/-2% of the dc value.
  2. V<sub>TT</sub> is not applied directly to the device. V<sub>TT</sub> is a system supply for signal termination resistors, is expected to be set equal to V<sub>REF</sub>, and must track variations in the DC level of V<sub>REF</sub>
  3. V<sub>ID</sub> is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .
  4. The ratio of the pullup current to the pulldown current is specified for the same temperature and voltage, over the entire temperature and voltage range, for device drain to source voltages from 0.25V to 1.0V. For a given output, it represents the maximum difference between pullup and pulldown drivers due to process variation. The full variation in the ratio of the maximum to minimum pullup and pulldown current will not exceed 1/7 for device drain to source voltages from 0.1 to 1.0.
  5. This is the DC voltage supplied at the DRAM and is inclusive of all noise up to 20MHz. Any noise above 20MHz at the DRAM generated from any source other than the DRAM itself may not exceed the DC voltage range of 2.6V +/-100mV.

DDR SDRAM Spec Items & Test Conditions

Conditions	Symbol
<b>Operating current - One bank Active-Precharge;</b> tRC=tRCmin; tCK=5ns for DDR400; DQ,DM and DQS inputs changing once per clock cycle; address and control inputs changing once every two clock cycles; CS = high between valid commands.	IDD0
<b>Operating current - One bank operation ;</b> One bank open, BL=4, Reads - Refer to the following page for detailed test condition; CS = high between valid commands.	IDD1
<b>Precharge power-down standby current;</b> All banks idle; power - down mode; CKE = <VIL(max); tCK=5ns for DDR400; Vin = Vref for DQ,DQS and DM.	IDD2P
<b>Precharge Floating standby current;</b> CS# >= VIH(min);All banks idle; CKE >= VIH(min); tCK=5ns for DDR400; Address and other control inputs changing once per clock cycle; Vin = Vref for DQ,DQS and DM	IDD2F
<b>Precharge Quiet standby current;</b> CS# >= VIH(min); All banks idle; CKE >= VIH(min); tCK=5ns for DDR400; Address and other control inputs stable at >= VIH(min) or =<VIL(max); Vin = Vref for DQ ,DQS and DM	IDD2Q
<b>Active power - down standby current ;</b> one bank active; power-down mode; CKE=< VIL (max); tCK=5ns DDR400; Vin = Vref for DQ,DQS and DM	IDD3P
<b>Active standby current;</b> CS# >= VIH(min); CKE>=VIH(min); one bank active; active - precharge; tRC=tRASmax; tCK=5ns for DDR400; DQ, DQS and DM inputs changing twice per clock cycle; address and other control inputs changing once per clock cycle	IDD3N
<b>Operating current - burst read;</b> Burst length = 2; reads; contiguous burst; One bank active; address and control inputs changing once per clock cycle; CL=3 at 5ns for DDR400; 50% of data changing on every transfer; Iout = 0 mA	IDD4R
<b>Operating current - burst write;</b> Burst length = 2; writes; continuous burst; One bank active address and control inputs changing once per clock cycle; CL=3 at tCK=5ns for DDR400; DQ, DM and DQS inputs changing twice per clock cycle, 50% of input data changing at every transfer	IDD4W
<b>Auto refresh current;</b> tRC = tRFC(min) - 14*tCK for DDR400 at tCK=5ns;	IDD5
<b>Self refresh current;</b> CKE =< 0.2V; External clock on; tCK = 5ns for DDR400.	IDD6

Input/Output Capacitance

(V<sub>DD</sub>=2.6, V<sub>DDQ</sub>=2.6V, T<sub>A</sub>= 25°C, f=1MHz)

Parameter	Symbol	Min	Max	Delta	Unit	Note
Input capacitance (A0 ~ A12, BA0 ~ BA1, CKE, $\overline{CS}$ , $\overline{RAS}$ , $\overline{CAS}$ , $\overline{WE}$ )	CIN1	2	3	0.5	pF	4
Input capacitance( CK, $\overline{CK}$ )	CIN2	2	3	0.25	pF	4
Data & DQS input/output capacitance	COUT	4	5	0.5	pF	1,2,3,4
Input capacitance(DM for 8, UDM/LDM for x16)	CIN3	4	5		pF	1,2,3,4

- Note :**
- These values are guaranteed by design and are tested on a sample basis only.
  - Although DM is an input -only pin, the input capacitance of this pin must model the input capacitance of the DQ and DQS pins. This is required to match signal propagation times of DQ, DQS, and DM in the system.
  - Unused pins are tied to ground.
  - This parameter is sampled. VDDQ = +2.6V +0.1V, VDD = +2.6V +0.1V, f=100MHz, tA=25°C, Vout(dc) = VDDQ/2, Vout(peak to peak) = 0.2V. DM inputs are grouped with I/O pins - reflecting the fact that they are matched in loading (to facilitate trace matching at the board level).

## DDR SDRAM I<sub>DD</sub> spec table

(V<sub>DD</sub>=2.7V, T = 10°C)

### < Detailed test conditions for DDR SDRAM IDD1 & IDD7A >

#### IDD1 : Operating current: One bank operation

- Only one bank is accessed with t<sub>RC</sub>(min), Burst Mode, Address and Control inputs change logic state once per Deselect cycle.  
I<sub>out</sub> = 0mA

#### 2. Timing patterns

- CC/C4(200Mhz,CL=3) : t<sub>CK</sub>=5ns, CL=3, BL=4, t<sub>RCD</sub>=3\*t<sub>CK</sub>(CC) 4\*t<sub>CK</sub>(C4), t<sub>RC</sub>=11\*t<sub>CK</sub>(CC) 12\*t<sub>CK</sub>(C4), t<sub>RAS</sub>=8\*t<sub>CK</sub>  
 Setup : A0 N N R0 N N N N P0 N N  
 Read : A0 N N R0 N N N N P0 N N - repeat the same timing with random address changing  
 \*50% of data changing at every transfer

#### IDD7A : Operating current: Four bank operation

- Four banks are being interleaved with t<sub>RC</sub>(min), Burst Mode, Address and Control inputs on Deselet edge are not changing.  
I<sub>out</sub> = 1mA

#### 2. Timing patterns

- CC/C4(200Mhz,CL=3) : t<sub>CK</sub>=5ns, CL=3, BL=4, t<sub>RCD</sub>=3\*t<sub>CK</sub>(CC) 4\*t<sub>CK</sub>(C4), t<sub>RC</sub>=11\*t<sub>CK</sub>(CC) 12\*t<sub>CK</sub>(C4), t<sub>RAS</sub>=8\*t<sub>CK</sub>  
 Setup : A0 N A1 RA0 A2 RA1 A3 RA2 N RA3 N N  
 Read : A0 N A1 RA0 A2 RA1 A3 RA2 N RA3 N N - repeat the same timing with random address changing  
 \*50% of data changing at every transfer

Legend : A = Activate, R=Read, W=Write, P=Precharge, N=NOP

AC Operating Conditions

Parameter/Condition	Symbol	Min	Max-10	Unit	Note
Input High (Logic 1) Voltage, DQ, DQS and DM signals	V <sub>IH</sub> (AC)	VREF + 0.31		V	
Input Low (Logic 0) Voltage, DQ, DQS and DM signals.	V <sub>IL</sub> (AC)		VREF - 0.31	V	
Input Differential Voltage, CK and CK inputs	V <sub>ID</sub> (AC)	0.7	VDDQ+0.6	V	1
Input Crossing Point Voltage, CK and CK inputs	V <sub>IX</sub> (AC)	0.5*VDDQ-0.2	0.5*VDDQ+0.2	V	2

Notes :

1. V<sub>ID</sub> is the magnitude of the difference between the input level on CK and the input level on /CK.
2. The value of V<sub>IX</sub> is expected to equal 0.5\*VDDQ of the transmitting device and must track variations in the dc level of the same.

AC Overshoot/Undershoot specification for Address and Control Pins

Parameter	Specification
	<b>DDR400</b>
Maximum peak amplitude allowed for overshoot	1.5V
Maximum peak amplitude allowed for undershoot	1.5V
The area between the overshoot signal and VDD must be less than or equal to	4.5V-ns
The area between the undershoot signal and GND must be less than or equal to	4.5V-ns

AC overshoot/Undershoot Definition

Overshoot/Undershoot specification for Data, Strobe, and Mask Pins

Parameter	Specification
	DDR400
Maximum peak amplitude allowed for overshoot	1.2V
Maximum peak amplitude allowed for undershoot	1.2V
The area between the overshoot signal and VDD must be less than or equal to	2.5V-ns
The area between the undershoot signal and GND must be less than or equal to	2.5V-ns

DQ/DM/DQS AC overshoot/Undershoot Definition

**Component Notes**

1. VID is the magnitude of the difference between the input level on CK and the input level on  $\overline{CK}$ .
2. The value of VIX is expected to equal 0.5\*VDDQ of the transmitting device and must track variations in the dc level of the same.
3. tHZ and tLZ transitions occur in the same access time windows as valid data transitions. these parameters are not referenced to a specific voltage level but specify when the device output in no longer driving (HZ), or begins driving (LZ).
4. The maximum limit for this parameter is not a device limit. The device will operate with a greater value for this parameter, but system performance (bus turnaround) will degrade accordingly.
5. The specific requirement is that DQS be valid (HIGH, LOW, or at some point on a valid transition) on or before this CK edge. A valid transition is defined as monotonic and meeting the input slew rate specifications of the device. when no writes were previously in progress on the bus, DQS will be transitioning from High- Z to logic LOW. If a previous write was in progress, DQS could be HIGH, LOW, or transitioning from HIGH to LOW at this time, depending on tDQSS.
6. A maximum of eight AUTO REFRESH commands can be posted to any given DDR SDRAM device.
7. For command/address input slew rate  $\geq 0.5$  V/ns
8. For CK &  $\overline{CK}$  slew rate  $\geq 0.5$  V/ns
9. These parameters guarantee device timing, but they are not necessarily tested on each device. They may be guaranteed by device design or tester correlation.
10. Slew Rate is measured between VOH(ac) and VOL(ac).
11. Min (tCL, tCH) refers to the smaller of the actual clock low time and the actual clock high time as provided to the device (i.e. this value can be greater than the minimum specification limits for tCL and tCH)....For example, tCL and tCH are = 50% of the period, less the half period jitter (tJIT(HP)) of the clock source, and less the half period jitter due to crosstalk (tJIT(crosstalk)) into the clock traces.
12. tQH = tHP - tQHS, where:  
tHP = minimum half clock period for any given cycle and is defined by clock high or clock low (tCH, tCL). tQHS accounts for 1) The pulse duration distortion of on-chip clock circuits; and 2) The worst case push-out of DQS on one transition followed by the worst case pull-in of DQ on the next transition, both of which are, separately, due to data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers.
13. tDQSQ  
Consists of data pin skew and output pattern effects, and p-channel to n-channel variation of the output drivers for any given cycle.
14. tDAL = (tWR/tCK) + (tRP/tCK)  
For each of the terms above, if not already an integer, round to the next highest integer. Example: For DDR400(CC) at CL=3 and tCK=5ns tDAL = (15 ns / 5 ns) + (15 ns/ 5ns) = {(3) + (3)}CLK  
tDAL = 6 clocks
15. In all circumstances, tXSNR can be satisfied using tXSNR=tRFCmin+1\*tCK
16. The only time that the clock frequency is allowed to change is during self-refresh mode.

## System Characteristics for DDR SDRAM

The following specification parameters are required in systems using DDR400 devices to ensure proper system performance. These characteristics are for system simulation purposes and are guaranteed by design.

**Table 1 : Input Slew Rate for DQ, DQS, and DM**

AC CHARACTERISTICS		DDR400			
PARAMETER	SYMBOL	MIN	MAX	UNITS	NOTES
DQ/DM/DQS input slew rate measured between VIH(DC), VIL(DC) and VIL(DC), VIH(DC)	DCSLEW	0.5	4.0	V/ns	a, k

**Table 2 : Input Setup & Hold Time Derating for Slew Rate**

Input Slew Rate	tIS	tIH	UNITS	NOTES
0.5 V/ns	0	0	ps	h
0.4 V/ns	+50	0	ps	h
0.3 V/ns	+100	0	ps	h

**Table 3 : Input/Output Setup & Hold Time Derating for Slew Rate**

Input Slew Rate	tDS	tDH	UNITS	NOTES
0.5 V/ns	0	0	ps	j
0.4 V/ns	+75	+75	ps	j
0.3 V/ns	+150	+150	ps	j

**Table 4 : Input/Output Setup & Hold Derating for Rise/Fall Delta Slew Rate**

Delta Slew Rate	tDS	tDH	UNITS	NOTES
+/- 0.0 V/ns	0	0	ps	i
+/- 0.25 V/ns	+50	+50	ps	i
+/- 0.5 V/ns	+100	+100	ps	i

**Table 5 : Output Slew Rate Characteristic (X8 Devices only)**

Slew Rate Characteristic	Typical Range (V/ns)	Minimum (V/ns)	Maximum (V/ns)	NOTES
Pullup Slew Rate	1.2 ~ 2.5	1.0	4.5	a,c,d,f,g
Pulldown slew	1.2 ~ 2.5	1.0	4.5	b,c,d,f,g

**Table 6 : Output Slew Rate Characteristic (X16 Devices only)**

Slew Rate Characteristic	Typical Range (V/ns)	Minimum (V/ns)	Maximum (V/ns)	NOTES
Pullup Slew Rate	1.2 ~ 2.5	0.7	5.0	a,c,d,f,g
Pulldown slew	1.2 ~ 2.5	0.7	5.0	b,c,d,f,g

**Table 7 : Output Slew Rate Matching Ratio Characteristics**

AC CHARACTERISTICS	DDR400		
PARAMETER	MIN	MAX	NOTES
Output Slew Rate Matching Ratio (Pullup to Pulldown)	-	-	e,k

**System Notes :**

a. Pullup slew rate is characterized under the test conditions as shown in Figure 1.

Figure 1 : Pullup slew rate test load

b. Pulldown slew rate is measured under the test conditions shown in Figure 2.

Figure 2 : Pulldown slew rate test load

c. Pullup slew rate is measured between (VDDQ/2 - 320 mV +/- 250 mV)

Pulldown slew rate is measured between (VDDQ/2 + 320 mV +/- 250 mV)

Pullup and Pulldown slew rate conditions are to be met for any pattern of data, including all outputs switching and only one output switching.

Example : For typical slew rate, DQ0 is switching

For minimum slew rate, all DQ bits are switching from either high to low, or low to high.

For Maximum slew rate, only one DQ is switching from either high to low, or low to high.

The remaining DQ bits remain the same as for previous state.

d. Evaluation conditions

Typical : 25 °C (T Ambient), VDDQ = 2.6V, typical process

Minimum : 70 °C (T Ambient), VDDQ = 2.5V, slow - slow process

Maximum : 0 °C (T Ambient), VDDQ = 2.7V, fast - fast process

e. The ratio of pullup slew rate to pulldown slew rate is specified for the same temperature and voltage, over the entire temperature and voltage range. For a given output, it represents the maximum difference between pullup and pulldown drivers due to process variation.

f. Verified under typical conditions for qualification purposes.

g. TSOP11 package divces only.

h. A derating factor will be used to increase tIS and tIH in the case where the input slew rate is below 0.5

V/ns as shown in Table 2. The Input slew rate is based on the lesser of the slew rates determined by either VIH(AC) to VIL(AC) or VIH(DC) to VIL(DC), similarly for rising transitions.

i. A derating factor will be used to increase tDS and tDH in the case where DQ, DM, and DQS slew rates differ, as shown in Tables 3 & 4.

Input slew rate is based on the larger of AC-AC delta rise, fall rate and DC-DC delta rise, Input slew rate is based on the lesser of the slew rates determined by either VIH(AC) to VIL(AC) or VIH(DC) to VIL(DC), similarly for rising transitions.

The delta rise/fall rate is calculated as:

$$\{1/(\text{Slew Rate1})\} - \{1/(\text{Slew Rate2})\}$$

For example : If Slew Rate 1 is 0.5 V/ns and slew Rate 2 is 0.4 V/ns, then the delta rise, fall rate is - 0.5ns/V . Using the table given, this would result in the need for an increase in tDS and tDH of 100 ps.

- j. Table 3 is used to increase  $t_{DS}$  and  $t_{DH}$  in the case where the I/O slew rate is below 0.5 V/ns. The I/O slew rate is based on the lesser of the AC ~ AC slew rate and the DC- DC slew rate. The input slew rate is based on the lesser of the slew rates determined by either  $V_{IH}(ac)$  to  $V_{IL}(ac)$  or  $V_{IH}(DC)$  to  $V_{IL}(DC)$ , and similarly for rising transitions.
- k. DQS, DM, and DQ input slew rate is specified to prevent double clocking of data and preserve setup and hold times. Signal transitions through the DC region must be monotonic.
