

## VC-710 Voltage Controlled Crystal Oscillator

### Features

- Small Industry Standard Package, 5.0 x 7.5 x 1.8 mm
- Output Frequencies from 120 MHz to 200 MHz
- 3.3 V Operation
- HFF crystal for ultra low jitter
- Complementary PECL Outputs
- Low phase noise and custom options
- 0/70° C or -40/85° C operating temperature
- Enable /Disable (PECL)
- RoHS compliant lead free construction

### Applications

PLL circuits for Clock Smoothing and Frequency Translation

- Fiber Channel
- SONET
- SDH, ITU-T G.709
- SONET, GR-253-CORE Issue3

### Description

The VC-710 is a voltage controlled crystal oscillator that operates at the fundamental frequency of the internal HFF crystal. The HFF crystal is a high-Q quartz device that enables the circuit to achieve low phase jitter performance over a wide operating temperature range. The oscillator is housed in an industry standard hermetically sealed leadless surface mount package and is available on tape and reel.

- Test Circuit Notes:**
- 1) To Permit 50Ω Measurement of Outputs, all DC Inputs are Biased Down 1.3V.
  - 2) All Voltage Sources Contain Bypass Capacitors to Minimize Supply Noise.
  - 3) 50Ω Terminations are Within Test Equipment.

## Absolute Maximum Ratings

Parameter	Symbol	Ratings	Unit
Power Supply	$V_{CC}$	0 to 6	V
Voltage Control Range	$V_C$	0 to $V_{CC}$	V
Storage Temperature	TS	-55 to 125	°C
Soldering Temp/Time	$T_{LS}$	240/10	°C/sec

Stresses in excess of the absolute maximum ratings can permanently damage the device. Functional operation is not implied at these or any other conditions in excess of conditions represented in the operational sections of this data sheet. Exposure to absolute maximum ratings for extended periods may adversely affect device reliability.

## Reliability

The VC-710 family is capable of meeting the following qualification tests:

## Environmental Compliance

Parameter	Conditions
Mechanical Shock	MIL-STD-883, Method 2002
Mechanical Vibration	MIL-STD-883, Method 2007
Solderability	MIL-STD-883, Method 2003
Gross and Fine Leak	MIL-STD-883, Method 1014
Resistance to Solvents	MIL-STD-883, Method 2015

## Handling Precautions

Although ESD protection circuitry has been designed into the VC-710 proper precautions should be taken when handling and mounting. VI employs a human body model and a charged-device model (CDM) for ESD susceptibility testing and design protection evaluation.

## ESD Ratings

Model	Minimum	Conditions
Human Body Model	500	MIL-STD 883, Method 3015
Charged Device Model	500	JESD 22-C101

## Recommended Solder Reflow Profile

VI qualification includes aging at various extreme temperatures, shock and vibration, temperature cycling, and IR reflow simulation. The conditions a device can withstand are well understood and devices can be subjected to the profile above. This profile shows a ramp up condition to prevent thermal shock, a preheat period in which the flux is activated, a ramp up to 183°C which is the reflow temperature of Sn/Pb eutectic, and a gradual cool down. The time above 183°C should not exceed 60 seconds and the peak temperature should be no more than 220°C for 10 seconds. The VC-710's are hermetically sealed so an aqueous wash is not an issue.
