

Latch/Flip-Flops

54F573, 54F574

FEATURES

- 54F573 is broadside pinout version of 54F373
- 54F574 is broadside pinout version of 54F374
- Inputs and outputs on opposite side of package allow easy interface to microprocessors
- Useful as an input or output port for microprocessors
- 3-State outputs for bus interfacing
- Common Output Enable

DESCRIPTION

The 54F573 is an octal transparent latch coupled to eight 3-State output buffers. The two sections of the device are controlled independently by Enable (E) and Output Enable (OE) control gates.

The 54F573 is functionally identical to the 54F373 but has broadside pinout configuration to facilitate PC board layout and allow easy interface with microprocessors.

The data on the D inputs is transferred to the latch outputs when the Enable (E) input is High. The latch remains transparent to the data input while E is High and stores the data that is present one set-up time before the High-to-Low enable transition.

The 54F574 is functionally identical to the 54F374 but has a broadside pinout configuration to facilitate PC board layout and allow easy interface with microprocessors.

The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active Low Output Enable (OE) controls all eight 3-State buffers independent of the latch operation. When OE is Low, the latched or transparent data appears at the outputs. When OE is High, the outputs are in high impedance "off" state, which means they will neither drive nor load the bus.

impedance "off" state, which means they will neither drive nor load the bus.

It is a 8-bit, edge triggered register coupled to eight 3-State output buffers. The two sections of the device are controlled independently by the clock (CP) and Output Enable (OE) control gates. The register is full edge triggered. The state of each D input, one set-up time before the Low-to-High clock transition is transferred to the corresponding flip-flop's Q output.

The 3-State output buffers are designed to drive heavily loaded 3-State buses, MOS memories, or MOS microprocessors. The active Low Output Enable (OE) controls all eight 3-State buffers independent of the latch operation. When OE is Low, the latched or transparent data appears at the outputs. When OE is High, the outputs are in high impedance "off" state, which means they will neither drive nor load the bus.

ORDERING INFORMATION

DESCRIPTION	ORDER CODE	PACKAGE DESIGNATOR*
20-Pin Ceramic DIP	54F573/BRA, 54F574/BRA	GDIP1-T20
20-Pin Ceramic Flat Pack	54F573/BSA, 54F574/BSA	DGFP2-F20
20-Pin Ceramic LLCC	54F573/B2A, 54F574/B2A	CQCC2-N20

* MIL-STD 1835 or Appendix A of 1995 Military Data Handbook

INPUT AND OUTPUT LOADING AND FAN-OUT TABLE

PINS	DESCRIPTION	54F(U.L.) HIGH/LOW	LOAD VALUE HIGH/LOW
D ₀ - D ₇	Data inputs	1.0/1.0	20µA/0.6mA
E (54F573)	Latch enable input (active High)	1.0/1.0	20µA/0.6mA
OE	Output enable input (active Low)	1.0/1.0	20µA/0.6mA
CP (54F574)	Clock pulse input (active rising edge)	1.0/1.0	20µA/0.6mA
Q ₀ - Q ₇	3-State outputs	50/33.3	3.0mA/20mA

NOTE: One (1.0) FAST Unit Load (U.L.) is defined as: 20µA in the High state and 0.6mA in the Low state.

NOTES:

- For conditions shown as Min or Max, use the appropriate value specified under recommended operating conditions for the applicable type and function table for operating mode.
- All typical values are at V_{CC} = 5V, T_A = 25°C.
- Not more than one output should be shorted at a time. For testing I_{OS}, the use of high-speed test apparatus and/or sample-and-hold techniques are preferable in order to minimize internal heating and more accurately reflect operational values. Otherwise, prolonged shorting of a High output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.
- This parameter is guaranteed, but not tested.

INPUT PULSE CHARACTERISTICS

Family	Rep. Rate	t_W	t_{TLH}	t_{THL}
54F	1MHz	500ns	$\leq 2.5ns$	$\leq 2.5ns$

DEFINITIONS:

R_L = Load Resistor; see AC Characteristics for value.
 C_L = Load capacitance includes jig and probe capacitance; see AC Characteristics for value.
 R_T = Termination resistance should be equal to Z_{OUT} of pulse generators.
 V_X = Unclocked pins must be held at: $\leq 0.8V$; $\geq 2.7V$ or open per Function Table.
