★ DESCRIPTION

The 'FCT520 and 'FCT521 are multi-level 8-bit wide pipeline registers. Each device consists of 4 registers A1, A2, B1 and B2 which are configured by the instruction inputs I_0 , I_1 as a single 4-level pipeline or as two 2-level pipelines. The contents of any register may be read at the multiplexed output at any time by using the mux-selection controls S_0 and S_1 .

The pipeline registers are positive edge triggered and data is shifted by the rising edge of the clock input. Instruction $I = 0$ selects the 4-level pipeline mode. Instruction $I = 1$ selects the 2-level B pipeline while $I = 2$ selects the 2-level

A pipeline. $I = 3$ is the HOLD instruction; no shifting is performed by the clock in this mode.

The 'FCT520 and 'FCT521 differ only in the 2-level operation mode. For the 'FCT520, data is shifted from level 1 to level 2 and new data is loaded into level 1. In the 'FCT521, new data is overwritten into level 1. To shift data from level 1 to level 2 in the 'FCT521, the 4-level pipeline mode must be used. Note that new data will also be clocked into both A1 and B1 during this 4-level shift operation.

The 'FCT520 and 'FCT521 are available in standard 24-pin 300 mil DIP, SOIC and 28-pad square LCC package.

Notes: 1807 Tbl 05

1. Typical limits are at V_{CC} = 5.0V, T_A = +25°C ambient.
 2. Not more than one output should be shorted at a time. Duration of short should not exceed one second. The use of high speed test apparatus and/or sample and hold techniques are preferable in order to minimize internal chip heating and more accurately reflect

operational values. Otherwise prolonged shorting of a high output may raise the chip temperature well above normal and thereby cause invalid readings in other parameter tests. In any sequence of parameter tests, I_{OS} tests should be performed last.

3. This parameter is guaranteed but not tested.
